- 33. Molecular nitrogen is less reactive than that of oxygen because nitrogen has high dissociation energy in comparison to oxygen so, its reactivity is less. Also bond length of nitrogen is shorter oxygen because of presence of triple bond between nitrogen atoms. So, both are true but not correct explanation.
- 34. The acidic nature increases from H_2O to H_2Te . The increase in acidic character of hydrides on moving down the group may be explained in terms of bond length of H – M bond, larger is bond-length, lesser is is bond energy and thus easier is ionization of H – M bond or easier is proton donor nature. Hence,
