## STRAIGHT LINE

## SYNOPSIS AND FORMULAE

## 1. Inclination of a Line

i. The angle between the line and the positive direction of $x$-axis is called the inclination of the line.
ii. If ' $\theta$ ' is the inclination of a ling the $\theta \pm \frac{\pi}{2}$ is the inclination of its perpendicular line according at $\theta$ is acute or obtuse.
iii. Inclination of parallel lines are equal.

## 2. Slope of Line

i. If ' $\theta$ ' is the inclination of a line, then ' $\tan \theta$ ' is called its 'slope' and is denoted by ' $m$ '.
ii. The slope of a horizontal line (i.e. a line parallel to $x$-axis) is zero.
iii. The slope of a vertical line (i.e. a line perpendicular to $x$-axis) is not defined.
iv. The slopes of parallel line are equal.
$v$. If $m_{1}, m_{2}$ are the slopes of two mutually perpendicular lines, then $m_{1} m_{2}=-1$ (non vertical).
vi. The slope of a line passing through $\mathrm{A}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right), \mathrm{B}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)$ is $\frac{y_{1}-y_{2}}{x_{1}-x_{2}}$, when $\mathrm{x}_{1} \neq \mathrm{x}_{2}$.
vii. If a line cuts $x$-axis at $A(a, 0)$ and $y$-axis at $B(0, b)$,then the slope of $A B$ is $\frac{-b}{a}$, where
' $a$ ' is the $x$-intercept and ' $b$ ' is the $y$-intercept.
