## COORDINATE SYSTEM

## 2D GEOMETRY

## SYNOPSIS

1. The distance between the point $\mathrm{A}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)$ and $\mathrm{B}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)$ is $\mathrm{AB}=\sqrt{\left(x_{2}-x_{1}\right)^{2}+\left(y_{2}-y_{1}\right)^{2}}$.
2. Three or more points are said to be collinear if they lie in a line.
3. If $\mathrm{A}, \mathrm{B}$ and C are collinear, then $\mathrm{AB}+\mathrm{BC}=\mathrm{AC}$ or $\mathrm{AC}+\mathrm{CB}=\mathrm{AB}$ or $\mathrm{BA}+\mathrm{AC}=\mathrm{BC}$.
4. The point which divides the line segment joining the points $\mathrm{A}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right) \mathrm{B}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)$ in the ratio $1: \mathrm{m}$ is $\mathrm{P}\left(\frac{l x_{2}+m x_{1}}{l+m}, \frac{l y_{2}+m y_{1}}{l+m}\right)\left(1+\mathrm{m}^{1} 0\right)$.
Note (1) : $1 \mathrm{~m}>0$ then P lies internally and $\mathrm{lm}<0$ then P lies externally.
Note (2) : If P divides AB externally in the ratio $1: m$, then P lies on AB produced if $|\mathrm{m}|<|1|$ and on BA produced if $|\mathrm{m}|>|1|$.
5. The mid point of the line segment joining $\mathrm{A}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right) \mathrm{B}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)$ is $\left(\frac{x_{1}+x_{2}}{2}, \frac{y_{1}+y_{2}}{2}\right)$.
6. Let $\mathrm{A}, \mathrm{B}$ be two points. The points which divide $\overline{\mathrm{AB}}$ in the ratio $1: 2$ and $2: 1$ are called points of trisection of $\overline{\mathrm{AB}}$.
7. If $\mathrm{P}(\mathrm{x}, \mathrm{y})$ lies in the line joining $\mathrm{A}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right) \mathrm{B}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)$ then $\frac{\mathrm{x}_{1}-x}{x-x_{2}}=\frac{y_{1}-y}{y-y_{2}}$ and P divides in the ratio $\mathrm{x}_{1}-\mathrm{x}: \mathrm{x}-\mathrm{x}_{2}$ or $\mathrm{y}_{1}-\mathrm{y}: \mathrm{y}$
8. $x$-axis divides the line segment joining $\left(x_{1}, y_{1}\right)\left(x_{2}, y_{2}\right)$ in the ratio $-y_{1}: y_{2}$.
9. $y$-axis divides the line segment joining in the ratio $-x_{1}: x_{2}$.

If $D\left(a_{1}, b_{1}\right), E\left(a_{2}, b_{2}\right) F\left(a_{3}, b_{3}\right)$ are the mid points of the sides, , of DABC then $A=\left(a_{2}+a_{3}-a_{1}, b_{2}+b_{3}-b_{1}\right)$.
$B=\left(a_{3}+a_{1}-a_{2}, b_{3}+b_{1}-b_{2}\right)$.
$C=\left(a_{1}+a_{2}-a_{3}, b_{1}+b_{2}-b_{3}\right)$.
10. (a) If $\left(a_{1}, b_{1}\right),\left(a_{2}, b_{2}\right),\left(a_{3}, b_{3}\right)$ are three vertices of a parallelogram in order then fourth vertex is $\left(a_{1}+a_{3}-a_{2}, b_{1}+b_{3}-b_{2}\right)$.
Note: If three vertices of parallelogram are given and if order is not given then we get three points as fourth vertex.
i.e., if three non-collinear points are given then we get three parallelograms with these three as vertices of parallelogram.
Note (1) : If $D$ is midpoint of $B C$ of triangle $A B C$ then $\mathrm{AB}^{2}+\mathrm{AC}^{2}=2\left(\mathrm{AD}^{2}+\mathrm{BD}^{2}\right)$.
(2) Internal angular bisector of angle A of DABC divides the opposite side BC in the ratio AB : AC .
(3) If $a, b, c$ are lengths of sides $B C, C A, A B$ of $D A B C$ and if $I$ is incentre then $I$ divides the internal angular bisector AD in the ratio $\mathrm{b}+\mathrm{c}: \mathrm{a}$.
(4) Finding the fourth vertex of a quadrilateral when the order of 3 vertices is not given
(i) Rhombus or Square : If $\mathrm{A}, \mathrm{B}, \mathrm{C}$ are the 3 points such that $\mathrm{AB}=\mathrm{AC}$ then the fourth vertex of the rhombus is the vertex of the parallelogram opposite to A .
(ii) Rectangle : The fourth vertex is the vertex opposite to the vertex where right angle forms. If $G$ is centroid of $D A B C$ then
(i) $\mathrm{AB}^{2}+\mathrm{BC}^{2}+\mathrm{CA}^{2}=3\left(\mathrm{GA}^{2}+\mathrm{GB}^{2}+\mathrm{GC}^{2}\right)$.
(ii) Area of $\mathrm{DGAB}=$ Area of $\mathrm{DGBC}=$ Area of $\mathrm{DGCA}=1 / 3$ Area of DABC .

If $D, E, F$ are the mid points of sides $B C, C A, A B$ of $D A B C$ then
Area $\mathrm{DDEF}=$ Area of $\mathrm{DAFE}=$ Area of $\mathrm{DBDF}=$ Area of triangle $\mathrm{CED}=1 / 2$
Area of each parallelogram formed $=1 / 4$ Area of DABC .
In a triangle ABC if BC is the largest side then
(i) $\mathrm{AB}^{2}+\mathrm{AC}^{2}=\mathrm{BC}^{2}$ then triangle ABC is right angled.
(ii) $\mathrm{AB}^{2}+\mathrm{AC}^{2}>\mathrm{BC}^{2}$ then triangle ABC is Acute angled triangle.
(iii) $\mathrm{AB}^{2}+\mathrm{AC}^{2}<\mathrm{BC}^{2}$ then triangle ABC is Obtuse angled triangle.

Note : In the above 3 cases if $\mathrm{AB}=\mathrm{AC}$ then the triangle is isosceles also.
11. Harmonic conjugate points : If $P$ and $Q$ divide $A B$ internally and externally in the same ratio, then $P$ is called as harmonic conjugate of $Q$ and $Q$ is called as harmonic conjugate of P , also $\mathrm{P}, \mathrm{Q}$ are a pair of conjugate points w.r.t. A and B .
Note : (1) If $P, Q$ are harmonic conjugate points w.r.t $A, B$ then $A, B$ are harmonic conjugate points w.r.t. P, Q.
(2) If $P, Q$ divide $A B$ in the ratio $1: m$ internally and externally then $A, B$ divide PQ in the ratio $(1-\mathrm{m}):(1+\mathrm{m})$.
12. Let $G$ be the centroid of $\triangle A B C$ then
i) $G=\frac{A+B+C}{3}$
ii) $C=3 G-A-B$
13. Let $G$ be the centroid $\triangle A B C$ and $D, E, F$ be the midpoints of $B C, C A, A B$ respectively, then $G$ divides the medians $A D, B E, C F$ in the ratio $2: 1$.
14. Let $D, E, F$ be the midpoints of the sides of $\triangle A B C$ then centriod of $\triangle D E F=$ centriod of $\triangle A B C$.
15. The orthocentre of a right angled triangle is the vertex at the right angle.
16. The circumcentre of a right angled triangle is the midpoint of the hypotenuse.
17. For right angled triangle, circum radius $=\frac{\text { hypotenuse }}{2}$.
18. Orthocentre $O$, circumcentre $S$, centriod $G$ of a triangle are collinear, $G$ divides $\overline{O S}$ in the ratio $2: 1$. Then
$G=\frac{2 S+O}{3}, S=\frac{3 G-O}{2}, O=3 G-2 S$
19. If $O$ is the orthocentre of $\triangle A B C$ then $A, B, C$ are the orthocentres of $\triangle O B C, \triangle O C A, \triangle O A B$ respectively.
20. If $A\left(x_{1}, y_{1}\right), B\left(x_{2}, y_{2}\right), C\left(x_{3}, \mathrm{y}_{3}\right)$ are the vertices of $\triangle A B C$ and if $a=B C, b=C A, c=A B$ then incentre,

$$
I=\left(\frac{a x_{1}+b x_{2}+c x_{3}}{a+b+c}, \frac{a y_{1}+b y_{2}+c y_{3}}{a+b+c}\right)
$$

Excentre opposite to $A$ is

$$
I_{1}=\left(\frac{-a x_{1}+b x_{2}+c x_{3}}{-a+b+c}, \frac{-a y_{1}+b y_{2}+c y_{3}}{-a+b+c}\right)
$$

Excentre opposite to $B$ is
Excentre opposite to $C$ is

$$
\begin{aligned}
& I_{2}=\left(\frac{a x_{1}-b x_{2}+c x_{3}}{a-b+c}, \frac{a y_{1}-b y_{2}+c y_{3}}{a-b+c}\right) \\
& I_{3}=\left(\frac{a x_{1}+b x_{2}-c x_{3}}{a+b-c}, \frac{a y_{1}+b y_{2}-c y_{3}}{a+b-c}\right)
\end{aligned}
$$

21. Internal angular bisector of angle $A$ of $\triangle A B C$ divides the opposite side $B C$ in the ratio $A B: A C$.
22. If $a, b, c$ are lengths of sides $B C, C A, A B$ of $\triangle A B C$ and if $I$ is incentre then $I$ divides the internal angular bisector $A D$ in the ratio $b+c: a$
23. If $I$ is the incentre and $I_{1}, I_{2}, I_{3}$ are the excentres of $\triangle A B C$ then, $I$ is the orthocentre of $\Delta I_{1} I_{2} I_{3}$.
24. The area of the triangle formed by the points $A\left(x_{1}, y_{1}\right), B\left(x_{2}, y_{2}\right)$ and $C\left(x_{3}, y_{3}\right)$ is $\frac{1}{2}\left|\sum x_{1}\left(y_{2}-y_{3}\right)\right|$ or $\frac{1}{2}\left|\sum\left(x_{1} y_{2}-x_{2} y_{1}\right)\right|$ or $\frac{1}{2}\left|\begin{array}{ll}x_{1}-x_{2} & x_{1}-x_{3} \\ y_{1}-y_{2} & y_{1}-y_{3}\end{array}\right|$ (or) $\frac{1}{2}\left|\begin{array}{lll}1 & x_{1} & y_{1} \\ 1 & x_{2} & y_{2} \\ 1 & x_{3} & y_{3}\end{array}\right|$
25. The area of the triangle formed by the points $O(0,0), A\left(x_{1}, y_{1}\right), B\left(x_{2}, y_{2}\right)$ is $\frac{1}{2}\left|x_{1} y_{2}-x_{2} y_{1}\right|$.
26. The area of the quadrilateral formed by the points $A\left(x_{1}, y_{1}\right), B\left(x_{2}, y_{2}\right), C\left(x_{3}, y_{3}\right), D\left(x_{4}, y_{4}\right)$ taken in order is $\frac{1}{2}\left|\begin{array}{ll}x_{1}-x_{3} & x_{2}-x_{4} \\ y_{1}-y_{3} & y_{2}-y_{4}\end{array}\right|$.
27. If $G$ is centroid of $\triangle A B C$ then,

Area of $\triangle G A B=$ Area of $\triangle G B C=$ Area of $\triangle G C A=\frac{1}{3}$ Area of $\triangle A B C$.
28. If $D, E, F$ are the mid points of sides $B C, C A, A B$ of $\triangle A B C$ then
area $\triangle D E F=$ Area of $\triangle A F E=$ Area of $\triangle B D F=$ Area of $\triangle C E D=\frac{1}{4}$ Area of $\triangle A B C$.
29. If $D$ is the midpoint of $B C$ of a triangle $A B C$ then $A B^{2}+A C^{2}=2\left(A D^{2}+B D^{2}\right)$.
30. In a $\triangle A B C$, if $B C=a, C A=b, A B=c$ then
i) the length of median through $A$

$$
=\frac{1}{2} \sqrt{2 b^{2}+2 c^{2}-a^{2}}
$$

ii) $\cos A=\frac{b^{2}+c^{2}-a^{2}}{2 b c}$
31. If $G$ is centroid of $\triangle A B C$ and $D, E, F$ are the mid points of the sides $B C, C A, A B$ respectively then $A B^{2}+B C^{2}+C A^{2}=\frac{4}{3}\left(A D^{2}+B E^{2}+C F^{2}\right)=3\left(G A^{2}+G B^{2}+G C^{2}\right)$
32. Let $D, E, F$ be the feet of the altitudes and $X, Y, Z$ be the mid points of the sides of triangle $A B C$. Let $P, Q, \mathrm{R}$ are the mid points of $A O, B O, C O$ where ' $O$ ' is the orthocentre of the triangle. Then $D, E, F ; X, Y, Z ; P, Q, R$ lie on a circle called nine point circle of the triangle. The centre of the nine point circle (denoted by $N$ ) is the midpoint of the line segment joining the ortho centre and circum centre ie., $O N=N S$. Radius of the nine point circle $=R / 2$.
33. In a triangle $A B C$,
$O G: G S=2: 1 O N: N G: G S=3: 1: 2$
Here $G=$ centroid, $O=$ orthocentre,
$S=$ circum centre of $\triangle A B C, N=$ centre of nine point circle.
34. The orthocentre of the triangle with vertices $(0,0),\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)$ is

$$
=\left(\mathrm{k}\left(\mathrm{y}_{2}-\mathrm{y}_{1}\right), \mathrm{k}\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)\right) \text { where } \mathrm{k}=\frac{x_{1} x_{2}+y_{1} y_{2}}{x_{2} y_{1}-x_{1} y_{2}}
$$
