## Solutions:

1. Find the values of $a, b$ if $a x^{2}+b x y+3 y^{2}-5 x+2 y-3=0$ represents a circle. Also Find the radius and centre of the circle.

Sol. the equation of second degree $a x^{2}+2 h y+b y^{2}+2 g x+2 h y+c=0$ represents a circle if $\mathrm{a}=\mathrm{b}, \mathrm{h}=0, \mathrm{~g}^{2}+\mathrm{f}^{2}-\mathrm{c} \geq 0$
$\therefore a x^{2}+b x y+3 y^{2}-5 x+2 y-3=0 \quad$ represents a circle if $b=0, a=3$
Equation of circle is $3 x^{2}+3 y^{2}-5 x+2 y-3=0$
$x^{2}+y^{2}-\frac{5}{3} x+\frac{2}{6} y-1=0$
$\mathrm{g}=-\frac{5}{6} ; \mathrm{f}=\frac{2}{6} ; \mathrm{c}=-1$
$\mathrm{C}=(-\mathrm{g},-\mathrm{f})=\left(\frac{5}{6}, \frac{1}{3}\right)$
Radius $=\sqrt{g 2+f 2-c}$
$=\sqrt{\frac{25}{36}+\frac{1}{9}+1}=\frac{\sqrt{65}}{6}$
2. If $\theta$ is the angle between the tangents through a point $P$ to the circle $S=0$ then $\tan \frac{\theta}{2}=\frac{r}{\sqrt{S_{11}}}$ where $r$ is the radius of the circle.
Proof :

Let the two tangents from $P$ to the circle $S=0$ touch the circle at $Q, R$ and $\theta$ be the angle between these two tangents. Let $C$ be the centre of the circle. Now $\mathrm{QC}=\mathrm{r}, \mathrm{PQ}=\sqrt{\mathrm{S}_{11}}$ and $\triangle \mathrm{PQC}$ is a right angled triangle at Q .
$\therefore \tan \frac{\theta}{2}=\frac{\mathrm{QC}}{\mathrm{PQ}}=\frac{\mathrm{r}}{\sqrt{\mathrm{S}_{11}}}$
3. Show that circles given by the equations $x^{2}+y^{2}+6 x-8 y+12=0 ; \quad x^{2}+y^{2}-4 x+6 y+k$ $=0$ intersect each other orthogonally.

Sol. Given circles are
$x^{2}+y^{2}+6 x-8 y+12=0 ; \quad x^{2}+y^{2}-4 x+6 y+k=0$ from above circles,
$\mathrm{g}=-1, \mathrm{f}=-1, \mathrm{c}=-7, \quad \mathrm{~g}^{1}=\frac{-4}{3}, f^{1}=\frac{29}{6} ; \mathrm{c}^{1}=0$. therefore, $\quad \mathrm{c}+\mathrm{c}^{1}=-7+0$

$$
2 \mathrm{gg}^{1}+2 \mathrm{ff}^{1}=-2(-1)\left(\frac{-4}{3}\right)+2(-1) \frac{29}{6} \quad=\frac{8}{3}-\frac{29}{3}=\frac{-21}{3}=-7
$$

Therefore, $2 \mathrm{gg}^{1}+2 \mathrm{ff}^{1}=\mathrm{c}+\mathrm{c}^{1}$
Hence the given circles cut each other orthogonally.
Hence both the circles cut orthogonally.
4. Find the equation of tangent to the parabola $y^{2}=16 x$ inclined at an angle $60^{\circ}$ with its axis and also find the point of contact.
Sol.
Given parabola $\mathrm{y}^{2}=16 \mathrm{x}$

Inclination of the tangent is
$\theta=60^{\circ} \Rightarrow \quad m=\tan 60^{\circ}=\sqrt{3}$
Therefore equation of the tangent is $\mathrm{y}=\mathrm{mx}+\frac{\mathrm{a}}{\mathrm{m}}$
$\Rightarrow y=\sqrt{3} x+\frac{4}{\sqrt{3}}$
$\Rightarrow \sqrt{3} y=3 x+4$
Point of contact $=\left(\frac{\mathrm{a}}{\mathrm{m}^{2}}, \frac{2 \mathrm{a}}{\mathrm{m}}\right)=\left(\frac{4}{3}, \frac{8}{\sqrt{3}}\right)$
5. Find the eccentricity of the ellipse, in standard form, if its length of the latus rectum is equal to half of its major axis.
Sol.
Given, latus rectum is equal to half of its major axis

$$
\begin{aligned}
\Rightarrow \frac{2 b^{2}}{a} & =a \\
2 b^{2} & =a^{2}
\end{aligned}
$$

But $b^{2}=a^{2}\left(1-e^{2}\right)$
$2 a^{2}\left(1-e^{2}\right)=a^{2}$
$1-e^{2}=\frac{1}{2} \Rightarrow e^{2}=\frac{1}{2} \Rightarrow e=\frac{1}{\sqrt{2}}$
$\int \cos x \cos 3 x d x$ on $R$.
Sol. $\cos 3 x \cos x=\frac{1}{2}(2 \cos 3 x \cdot \cos x)$

$$
\frac{1}{2}(\cos 4 x+\cos 2 x)
$$

$$
\begin{aligned}
& \quad \int \cos x \cos 3 x d x=\frac{1}{2} \int \cos 4 x d x+\frac{1}{2} \cos 2 x d x \\
& = \\
& =\frac{1}{2}\left(\frac{\sin 4 x}{4}+\frac{\sin 2 x}{2}\right)+C \\
& =\frac{1}{8} \sin 4 x+2 \sin 2 x+C \\
& \text { 7. } \int \frac{\sin \left(\operatorname{Tan}^{-1} x\right)}{1+x^{2}} d x, x \in R \\
& \text { Sol. } \int \frac{\sin ^{2}\left(\operatorname{Tan}^{-1} x\right)}{1+x^{2}} d x \\
& \quad \operatorname{put}^{2} \tan ^{-1} x=t \Rightarrow \frac{d x}{1+x^{2}}=d t \\
& \int \frac{\sin \left(\operatorname{Tan}^{-1} x\right)}{1+x^{2}} d x=\int \sin t d t \\
& =-\cos t+t=-\cos \left(\tan { }^{-1} x\right)+C \\
& \int_{-\pi / 2}^{\pi / 2} \frac{\cos x}{1+e^{x}} d x
\end{aligned}
$$

8. 

Sol. Let $\mathrm{I}=\int_{-\pi / 2}^{\pi / 2} \frac{\cos \mathrm{x}}{1+\mathrm{e}^{\mathrm{x}}} \mathrm{dx}$

$$
\begin{aligned}
& I=\int_{-\pi / 2}^{\pi / 2} \frac{\cos (\pi / 2-\pi / 2-x) d x}{1+e^{-x}}\left(\because \int_{a}^{b} f(x) d x=\int_{a}^{b} f(a+b-x) d x\right)_{\text {Adding (1) and (2) , }} \\
& =\int_{-\pi / 2}^{\pi / 2} \frac{e^{x} \cos x d x}{1+e^{x}}--(2) \\
& 2 \mathrm{I}=\int_{-\pi / 2}^{\pi / 2} \frac{\cos x\left(1+\mathrm{e}^{\mathrm{x}}\right)}{1+\mathrm{e}^{\mathrm{x}}} \mathrm{dx}=\int_{-\pi / 2}^{\pi / 2} \cos \mathrm{xdx} \\
& 2 I=2 \int_{0}^{\pi / 2} \cos x d x \because \cos x \text { is even function } \\
& \Rightarrow I=\sin x_{0}^{\pi / 2} \Rightarrow I=1
\end{aligned}
$$

9. Find the area under the curve $f(x)=\cos x$ in $[0,2 \pi]$.

Sol: We know that $\cos x \geq 0$ in $\left(0, \frac{\pi}{2}\right) \cup\left(\frac{3 \pi}{2}, \pi\right)$ and $\leq 0$ in $\left(\frac{\pi}{2}, \frac{3 \pi}{2}\right)$

Required area
$=\int_{0}^{\frac{\pi}{2}} \cos x d x+\int_{\frac{\pi}{2}}^{\frac{3 \pi}{2}}-\cos x d x+\int_{\frac{3 \pi}{2}}^{2 \pi} \cos x d x$
$=\sin \mathrm{X}{ }_{0}^{\pi / 2}+-\sin \mathrm{X} \frac{\pi / 2}{3 \pi / 2}+\sin \mathrm{X}{ }_{3 \pi / 2}^{2 \pi}$
$=\sin \frac{\pi}{2}-\sin 0-\sin \frac{3 \pi}{2}+\sin \frac{\pi}{2}+\sin 2 \pi-\sin \frac{3 \pi}{2}$
$=1-0--1+1+0--1$
$=1+1+1+1=4$.
10. $y-x \frac{d y}{d x}=5\left(y^{2}+\frac{d y}{d x}\right)$

Sol. $y-5 y^{2}=(x+5) \frac{d y}{d x} \Rightarrow \frac{d x}{x+5}=\frac{d y}{y(1-5 y)}$
Integrating both sides

$$
\begin{aligned}
& \int \frac{d x}{x+5}=\int \frac{d y}{y(1-5 y)}=\int\left(\frac{1}{y}+\frac{5}{1-5 y}\right) d y \\
& \ln |x+5|=\ln y-\ln |1-5 y|+\ln c
\end{aligned}
$$

$$
\ln |x+5|=\ln \left|\frac{c y}{1-5 y}\right| \Rightarrow x+5=\left(\frac{c y}{1-5 y}\right)
$$

11. Find the equation of the tangents to the circle $x^{2}+y^{2}-4 x+6 y-12=0$ which are parallel to

$$
x+y-8=0
$$

Sol. Equation of the circle is
$S=x^{2}+y^{2}-4 x+6 y-12=0$

Centre is $C(2,-3) ; r=$ radius $=\sqrt{4+9+12}=5$
Equation of the given line is $x+y-8=0$
Equation of the line parallel to above line is $\mathrm{x}+\mathrm{y}+\mathrm{k}=0$
If $x+y+k=0$ is a tangent to the circle then
radius $=$ perpendicular distance from the centre.
$5=\frac{|2-3+k|}{\sqrt{1+1}}$
$\Rightarrow|k-1|=5 \sqrt{2} \Rightarrow \mathrm{k}-1= \pm 5 \sqrt{2} \Rightarrow \mathrm{k}=1 \pm 5 \sqrt{2}$
Equation of the tangent is
$\mathrm{x}+\mathrm{y}+1 \pm 5 \sqrt{2}=0$
12. The pole of the line $1 x+m y+n=0(n \neq 0)$ with respect to $x^{2}+y^{2}=a^{2}$ is $\left(-\frac{1 a^{2}}{n},-\frac{m a^{2}}{n}\right)$.

Proof :
Let $\mathrm{P}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)$ be the pole of $1 \mathrm{x}+\mathrm{my}+\mathrm{n}=0 \ldots$ (1)
The polar of P with respect to the circle is :

$$
\begin{equation*}
\mathrm{xx}_{1}+\mathrm{yy}_{1}-\mathrm{a}^{2}=0 \tag{2}
\end{equation*}
$$

Now (1) and (2) represent the same line
$\therefore \frac{\mathrm{x}_{1}}{\ell}=\frac{\mathrm{y}_{1}}{\mathrm{~m}}=\frac{-\mathrm{a}^{2}}{\mathrm{n}} \Rightarrow \mathrm{x}_{1}=\frac{-\mathrm{la}^{2}}{\mathrm{n}}, \mathrm{y}=\frac{-\mathrm{ma}^{2}}{\mathrm{n}}$
$\therefore$ Pole $\mathrm{P}=\left(-\frac{\mathrm{la}}{\mathrm{n}},-\frac{\mathrm{ma}^{2}}{\mathrm{n}}\right)$
13. Find the equation of the circle which passes through the points $(2,0),(0,2)$ and orthogonal to the circle
$2 x^{2}+2 y^{2}+5 x-6 y+4=0$
Sol. Let $S=x^{2}+y^{2}+2 g x+2 f y+c=0$
$\mathrm{S}=0$ is passing through $(2,0),(0,2)$,
$\Rightarrow 4+0+4 \mathrm{~g}+\mathrm{c}=0-\cdots(1)$
and $0+4+4 \mathrm{f}+\mathrm{c}=0-\cdots(2)$
(1) $-(2) \Rightarrow \mathrm{f}-\mathrm{g}=0 \Rightarrow g=f$
$S=0$ is orthogonal to $x^{2}+y^{2}+\frac{5}{2} x-\frac{6}{2} y+2=0$

$$
\Rightarrow 2 g\left(\frac{5}{4}\right)+2 f\left(-\frac{3}{2}\right)=2+c
$$

$\frac{5}{2} \mathrm{~g}-3 \mathrm{f}=2+\mathrm{c}$
But $\mathrm{g}=\mathrm{f} \Rightarrow \quad \frac{5}{2} \mathrm{~g}-3 \mathrm{~g}=2+\mathrm{c}$
$\Rightarrow-\mathrm{g}=4+2 \mathrm{c}$
Putting value of g in equation (1)

$$
\begin{aligned}
-16-8 c+c & =-4 \Rightarrow \quad c=-\frac{12}{7} \\
\Rightarrow-\mathrm{g} 4-\frac{24}{7} & =+\frac{4}{7}
\end{aligned}
$$

Equation of the circle is

$$
\begin{aligned}
& x^{2}+y^{2}-\frac{8 x}{7}+\frac{8 y}{7}+\frac{12}{7}=0 \\
& \Rightarrow 7\left(x^{2}+y^{2}\right)-8 x-8 y-12=0
\end{aligned}
$$

14. If $P N$ is the ordinate of a point $P$ on the ellipse $\frac{x^{2}}{a^{2}}+\frac{y^{2}}{b^{2}}=1$ and the tangent at $P$ meets the $X$-axis at $T$ then show that $(C N)(C T)=a^{2}$ where $C$ is the centre of the ellipse.
Sol: Let $\mathrm{P}(\theta)=(\mathrm{a} \cos \theta, \mathrm{b} \sin \theta)$ be a point on the ellipse $\frac{\mathrm{x}^{2}}{\mathrm{a}^{2}}+\frac{\mathrm{y}^{2}}{\mathrm{~b}^{2}}=1$. Then the equation of the tangent at $P(\theta)$ is
$\frac{\mathrm{x} \cos \theta}{\mathrm{a}}+\frac{\mathrm{y} \sin \theta}{\mathrm{b}}=1$ (or)
$\frac{\mathrm{x}}{\left(\frac{\mathrm{a}}{\cos \theta}\right)}+\frac{\mathrm{y}}{\left(\frac{\mathrm{b}}{\sin \theta}\right)}=1$ meets X -axis at T .

$\therefore \mathrm{X}$ - intercept $(\mathrm{CT})=\frac{\mathrm{a}}{\cos \theta}$ and the ordinate of P is $\mathrm{PN}=\mathrm{b} \sin \theta$ then its abssicca $\mathrm{CN}=\mathrm{a} \cos \theta$
$\therefore(C N) .(C T)=(a \cos \theta) \frac{a}{\cos \theta}=a^{2}$.
15. Find the equations of tangents drawn to the hyperbola $2 x^{2}-3 y^{2}=6$ through $(-2,1)$.

Sol. Equation of the hyperbola is $2 x^{2}-3 y^{2}=6$

$$
\Rightarrow \frac{x^{2}}{3}-\frac{y^{2}}{2}=1
$$

Let $m$ be the slope of the tangent.
The tangent id passing through $\mathrm{p}(-2,1)$.
Equation of the tangent is

$$
\begin{align*}
& y-1=m(x+2)=m x+2 m \\
& y=m x+(2 m+1) \tag{1}
\end{align*}
$$

since (1) is a tangent to the hyperbola,

$$
\begin{aligned}
c^{2}= & a^{2} m^{2}-b^{2} \\
& \Rightarrow(2 m+1)^{2}=3 m^{2}-2 \\
& \Rightarrow 4 m^{2}+4 m+1=3 m^{2}-2 \\
& \Rightarrow m^{2}+4 m+3=0 \Rightarrow(m+1)(m+3)=0 \\
& \Rightarrow m=-1 \text { or }-3
\end{aligned}
$$

Case 1) $m=-1$
Equation of the tangent is

$$
y=-x-1 \Rightarrow x+y+1=0
$$

## Case $2 \mathrm{~m}=-3$

Equation of the tangent is

$$
y=-3 x-5 \Rightarrow 3 x+y+5=0
$$

16. Evaluate $\lim _{\mathrm{n} \rightarrow \infty} \frac{\sqrt{\mathrm{n}+1}+\sqrt{\mathrm{n}+2}+\ldots+\sqrt{\mathrm{n}+\mathrm{n}}}{\mathrm{n} \sqrt{\mathrm{n}}}$

Sol: For determining the limit we use the result that if $f$ is continuous on $[0,1]$ and

$$
\mathrm{P}=\left\{0, \frac{1}{\mathrm{n}}, \frac{2}{\mathrm{n}}, \ldots, \frac{\mathrm{n}-1}{\mathrm{n}}, 1\right\} \text { is a partition then } \int_{0}^{1} \mathrm{f}(\mathrm{x}) \mathrm{dx}=\lim _{\mathrm{n} \rightarrow \infty} \frac{1}{\mathrm{n}} \sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{f}\left(\frac{\mathrm{i}}{\mathrm{n}}\right)
$$

$$
\text { Given } \lim _{\mathrm{n} \rightarrow \infty}\left(\frac{\sqrt{\mathrm{n}+1}+\sqrt{\mathrm{n}+2}+\ldots+\sqrt{\mathrm{n}+\mathrm{n}}}{\mathrm{n} \sqrt{\mathrm{n}}}\right)
$$

$$
=\lim _{\mathrm{n} \rightarrow \infty} \frac{1}{\mathrm{n}}\left(\frac{\sum_{\mathrm{i}=1}^{\mathrm{n}} \sqrt{\mathrm{n}} \sqrt{\left(1+\frac{1}{\mathrm{n}}\right)}+\sqrt{\mathrm{n}} \sqrt{\left(1+\frac{2}{\mathrm{n}}\right)}+\ldots+\sqrt{\mathrm{n}} \sqrt{\left(1+\frac{\mathrm{n}}{\mathrm{n}}\right)}}{\sqrt{\mathrm{n}}}\right)
$$

$$
=\lim _{\mathrm{n} \rightarrow \infty} \frac{1}{\mathrm{n}} \sum_{\mathrm{i}=1}^{\mathrm{n}} \sqrt{1+\frac{\mathrm{i}}{\mathrm{n}}}
$$

$$
=\int_{0}^{1} \sqrt{1+x} d x=\frac{2}{3}\left[(1+x)^{3 / 2}\right]_{0}^{1}
$$

$$
=\frac{2}{3}\left[2^{3 / 2}-1\right]=\frac{2}{3}[2 \sqrt{2}-1]
$$

17. $(2 x+2 y+3) \frac{d y}{d x}=x+y+1$

Sol. $\frac{d y}{d x}=\frac{x+y+1}{2 x+2 y+3}=\frac{x+y+1}{2 x+y+3}$

Let $v=x+y$ so that $\frac{d v}{d x}=1+\frac{d y}{d x}$

$$
\begin{aligned}
& \frac{\mathrm{dv}}{\mathrm{dx}}=1+\frac{\mathrm{v}+1}{2 \mathrm{v}+3}=\frac{2 \mathrm{v}+3+\mathrm{v}+1}{2 \mathrm{v}+3}=\frac{3 \mathrm{v}+4}{2 \mathrm{v}+3} \\
& \frac{2 \mathrm{v}+3}{3 \mathrm{v}+4} \mathrm{dv}=\mathrm{dx} \\
& \frac{2}{3} \int \mathrm{dv}+\frac{1}{9} \int \frac{3 \cdot d v}{3 \mathrm{v}+4}=\int \mathrm{dx} \\
& \frac{2}{3} \mathrm{v}+\frac{1}{9} \log (3 \mathrm{v}+4)=\mathrm{x}+\mathrm{c}
\end{aligned}
$$

Multiplying with 9
$6 v+\log (3 v+4)=9 x+9 c$
$6(x+y)+\log [3(x+y)+4]=9 x+c$
i.e. $\log (3 x+3 y+4)=3 x-6 y+c$
18. Find the equation of the circum circle of the triangle formed by the straight lines given in each of the following.
i) $2 x+y=4 ; x+y=6 ; x+2 y=5$
sol.
given lines are
$2 x+y=4$
$x+y=6$
$x+y=6$
$x+2 y=5$ $\qquad$

On solving (1) and (2), we get

$$
\mathrm{B}=(-2,8)
$$

On solving (1) and (3), we get
A = (1,2)
On solving (3) and (2), we get
C $=(7,-1)$
Let $S(h, k)$ be the circumcentre of the triangleABC
Then $S A=S B=S C$.
$\mathrm{SA}=\mathrm{SB} \Rightarrow \mathrm{SA}^{2}=\mathrm{SB}^{2}$
$\Rightarrow(1-\mathrm{h})^{2}+(2-\mathrm{k})^{2}=(-2-\mathrm{h})^{2}+(8-\mathrm{k})^{2}$
$\Rightarrow \mathrm{h}^{2}+\mathrm{k}^{2}-2 \mathrm{~h}-4 \mathrm{k}+5=\mathrm{h}^{2}+\mathrm{k}^{2}+4 \mathrm{~h}-16 \mathrm{k}+68$
$\Rightarrow 6 \mathrm{~h}-12 \mathrm{k}+63=0 \quad-------(4)$
$\mathrm{SA}=\mathrm{SC} \Rightarrow \mathrm{SA}^{2}=\mathrm{SC}^{2}$
$\Rightarrow(1-\mathrm{h})^{2}+(2-\mathrm{k})^{2}=(7-\mathrm{h})^{2}+(-1-\mathrm{k})^{2}$
$\Rightarrow h^{2}+k^{2}-2 h-4 k+5=h^{2}+k^{2}-14 h+2 k+50$
$=>12 h-6 \mathrm{k}-45=0-------(5)$
Solving (4) and (5), We get $S=(17 / 2,19 / 2)$
Now radius $=$ SA
$=\sqrt{\left(1-\frac{17}{2}\right)^{2}+\left(2-\frac{19}{2}\right)^{2}}=\frac{225}{\sqrt{2}}$
Euation of the circle is

$$
\begin{aligned}
& \left(x-\frac{17}{2}\right)^{2}+\left(y-\frac{19}{2}\right)^{2}=\frac{225}{2} \\
& =>x^{2}+y^{2}-17 x-19 y+50=0
\end{aligned}
$$

19.Find the locus of the foot of the perpendicular drawn from the origin to any chord of the circle $S \equiv x^{2}+y^{2}+2 g x+2 f y+c=0$ which subtends a right angle at the origin.

## Sol.

Let $\mathrm{P}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)$ be the foot of the perpendicular from the origin on the chord.
Slop a $\mathrm{OP}=\frac{y_{1}}{x_{1}}$
$\Rightarrow$ Slop of chord $=-\frac{x_{1}}{y_{1}}$
$\Rightarrow$ Equation of the chord is $\mathrm{y}-\mathrm{y}_{1}=-\frac{x_{1}}{y_{1}}\left(\mathrm{x}-\mathrm{x}_{1}\right)$
$\Rightarrow \mathrm{yy}_{1} \quad \mathrm{xx}_{1}=-\mathrm{xx}_{1}+x_{1}^{2}$
$\Rightarrow \mathrm{xx}_{1}+\mathrm{yy}_{1}=x_{1}^{2}+y_{1}^{2}$
$\Rightarrow \frac{x x_{1}+y y_{1}}{x_{1}{ }^{2}+y_{1}{ }^{2}}=1$ -
Equation of the circle is $x^{2}+y^{2}+2 f y+c=0 \quad$ - (2) Hamogenising (2) with the help of (1).
Then

$$

& \mathrm{x}^{2}\left[1+\frac{2 g x_{1}}{x_{1}^{2}+y_{1}^{2}}+\frac{c x_{1}^{2}}{\left(x_{1}^{2}+y_{1}^{2}\right)}\right]+\mathrm{y}^{2}\left[1+\frac{2 f y_{1}}{x_{1}^{2}+y_{1}^{2}}+\frac{c y_{1}^{2}}{\left(x_{1}^{2}+y_{1}^{2}\right)}\right]+(\ldots \ldots \ldots \ldots \ldots) \mathrm{xy}=0
